

American Lotus Aquatic Wetland (HAL)

The American Lotus Aquatic Wetland (HAL) map class represents the American Lotus Aquatic Wetland plant community (CEGL004323). This community is prevalent throughout the Mississippi River floodplain and grows in shallow backwaters in the vicinity of the Sny Magill Unit area. Patches of submersed aquatic plant species and duckweed may be found among the lotus leaves. Because of early senescence of this aquatic plant, we used the August-dated photography to confirm our interpretation of American lotus on the October-dated photography.
